Introduction

- Finding the minimal number of generators of a finite group H

Introduction

- Finding the minimal number of generators of a finite group H

Can be reduced to:

- Finding the minimal number of generators of a finite group H such that $d(H/N) \leq m$ for every non-trivial normal subgroup N, but $d(H) > m$

The case $m = 1$

Theorem

Let H be a finite nilpotent group such that $d(H/N) \leq 1$ for every non-trivial normal subgroup N, but $d(H) > 1$. Then $H \cong \mathbb{Z}_p \times \mathbb{Z}_p$ for some prime p.

The case $m = 1$

Theorem

Let H be a finite nilpotent group such that $d(H/N) \leq 1$ for every non-trivial normal subgroup N, but $d(H) > 1$. Then $H \cong \mathbb{Z}_p \times \mathbb{Z}_p$ for some prime p.

Proof.

- $H = P_1 \times \ldots \times P_n$ where P_i is a Sylow p_i-subgroup for $1 \leq i \leq n$ and $p_1, \ldots, p_n$ are distinct primes.

The case $m = 1$

Theorem

Let H be a finite nilpotent group such that $d(H/N) \leq 1$ for every non-trivial normal subgroup N, but $d(H) > 1$. Then $H \cong \mathbb{Z}_p \times \mathbb{Z}_p$ for some prime p.

Proof.

- $H = P_1 \times \ldots \times P_n$ where P_i is a Sylow p_i-subgroup for $1 \leq i \leq n$ and $p_1, \ldots, p_n$ are distinct primes.
- If $P_1, \ldots, P_n$ are cyclic, we obtain $H \cong \mathbb{Z}_{p_1 \ldots p_n}$ which contradicts $d(H) > 1$.Without loss of generality we can thus assume that P_1 is not cyclic.

The case $m = 1$

Theorem

Let H be a finite nilpotent group such that $d(H/N) \leq 1$ for every non-trivial normal subgroup N, but $d(H) > 1$. Then $H \cong \mathbb{Z}_p \times \mathbb{Z}_p$ for some prime p.

Proof.

- $H = P_1 \times \ldots \times P_n$ where P_i is a Sylow p_i-subgroup for $1 \leq i \leq n$ and $p_1, \ldots, p_n$ are distinct primes.
- If $P_1, \ldots, P_n$ are cyclic, we obtain $H \cong \mathbb{Z}_{p_1 \ldots p_n}$ which contradicts $d(H) > 1$.Without loss of generality we can thus assume that P_1 is not cyclic.
- $n \geq 2 \implies P_1 \cong H/(1 \times P_2 \ldots \times P_n)$ and thus $d(P_1) = d(H/(1 \times P_2 \ldots \times P_n)) = 1$, contradiction.

The case $m = 1$

Theorem

Let H be a finite nilpotent group such that $d(H/N) \leq 1$ for every non-trivial normal subgroup N, but $d(H) > 1$. Then $H \cong \mathbb{Z}_p \times \mathbb{Z}_p$ for some prime p.

Proof.

- $H = P_1 \times \ldots \times P_n$ where P_i is a Sylow p_i-subgroup for $1 \leq i \leq n$ and $p_1, \ldots, p_n$ are distinct primes.
- If $P_1, \ldots, P_n$ are cyclic, we obtain $H \cong \mathbb{Z}_{p_1 \ldots p_n}$ which contradicts $d(H) > 1$.Without loss of generality we can thus assume that P_1 is not cyclic.
- $n \geq 2 \implies P_1 \cong H/(1 \times P_2 \ldots \times P_n)$ and thus $d(P_1) = d(H/(1 \times P_2 \ldots \times P_n)) = 1$, contradiction.
- Since $d(H) = d(H/\Phi(H))$, $\Phi(H) = 1$.

The case $m = 1$

Proof.

- $H \cong H/\Phi(H)$ is a $\mathbb{F}_{p_1}$-vector space and thus $H \cong (\mathbb{Z}_{p_1})^q$

$\square$

The case $m = 1$

Proof.

- $H \cong H/\Phi(H)$ is a $\mathbb{F}_{p_1}$-vector space and thus $H \cong (\mathbb{Z}_{p_1})^q$
- $q = 2$ since

$$q - 1 = d((\mathbb{Z}_{p_1})^{q-1}) = d(H/(\mathbb{Z}_{p_1} \times 1 \times \ldots \times 1)) = 1.$$

$\square$

The groups L_k

Throughout L will always denote a finite group with a unique minimal normal subgroup M. Furthermore if M is abelian, we also assume that M is complemented in L.

The groups L_k

Throughout L will always denote a finite group with a unique minimal normal subgroup M. Furthermore if M is abelian, we also assume that M is complemented in L.

Definition

Given a positive integer k, the group L_k is a subgroup of L^k defined by:

$$L_k = \{(l_1, \ldots, l_k) \in L^k | l_1 M = \ldots = l_k M\}.$$

The group L_k can be described as $diag(L^k)M^k$.

Properties of L_k

Properties of L_k

- $soc(L_k) = M^k$

Properties of L_k

- $soc(L_k) = M^k$
- $L_k/M^k \cong L/M$

Properties of L_k

- $soc(L_k) = M^k$
- $L_k/M^k \cong L/M$
- If M is abelian and complemented by C in L, then M^k is complemented by $diag(C^k)$

Properties of L_k

- $soc(L_k) = M^k$
- $L_k/M^k \cong L/M$
- If M is abelian and complemented by C in L, then M^k is complemented by $diag(C^k)$
- The quotient of L_{k+1} by any of its minimal normal subgroups is isomorphic to L_k

Properties of L_k

- $soc(L_k) = M^k$
- $L_k/M^k \cong L/M$
- If M is abelian and complemented by C in L, then M^k is complemented by $diag(C^k)$
- The quotient of L_{k+1} by any of its minimal normal subgroups is isomorphic to L_k
- The sequence $d(L_k)_{k\in\mathbb{N}}$ is unlimited and non-decreasing.

Properties of L_k

- $soc(L_k) = M^k$
- $L_k/M^k \cong L/M$
- If M is abelian and complemented by C in L, then M^k is complemented by $diag(C^k)$
- The quotient of L_{k+1} by any of its minimal normal subgroups is isomorphic to L_k
- The sequence $d(L_k)_{k\in\mathbb{N}}$ is unlimited and non-decreasing.
- For all $k \in \mathbb{N}$, $d(L_{k+1}) \leq d(L_k) + 1$.

The function f

Definition

Given L we define $f(L, m) = k + 1$ if and only if $d(L_k) = m < d(L_{k+1})$. When L can be identified from the context, we denote $f(L, m)$ as $f(m)$.

The function f

Definition

Given L we define $f(L, m) = k + 1$ if and only if $d(L_k) = m < d(L_{k+1})$. When L can be identified from the context, we denote $f(L, m)$ as $f(m)$.

- Thus the function f gives us *the integer $k + 1$ for which any proper quotient of L_{k+1} has minimal number of generators smaller or equal to m but $d(L_{k+1}) > m$.*

The function f

Definition

Given L we define $f(L, m) = k + 1$ if and only if $d(L_k) = m < d(L_{k+1})$. When L can be identified from the context, we denote $f(L, m)$ as $f(m)$.

- Thus the function f gives us *the integer $k + 1$ for which any proper quotient of L_{k+1} has minimal number of generators smaller or equal to m but $d(L_{k+1}) > m$.*
- It follows from the last 2 properties of the groups L_k that this function is non-decreasing and unbounded.

General Case

Theorem

Let m be an integer with $m \geq 1$ and H a finite group such that $d(H/N) \leq m$ for every non-trivial normal subgroup N, but $d(H) > m$. Then there exists a group L which has a unique minimal normal subgroup M and is such that M is either non-abelian or complemented in L and $H \cong L_{f(L,m)}$.

General Case Proof

The proof is divided in 2 cases:

General Case Proof

The proof is divided in 2 cases:

- H has a unique minimal normal subgroup

General Case Proof

The proof is divided in 2 cases:

- H has a unique minimal normal subgroup
- H has more than one minimal normal subgroup

General Case Proof

The proof is divided in 2 cases:

- H has a unique minimal normal subgroup
- H has more than one minimal normal subgroup
  - Abelian minimal normal subgroups

General Case Proof

The proof is divided in 2 cases:

- H has a unique minimal normal subgroup
- H has more than one minimal normal subgroup
  - Abelian minimal normal subgroups
  - Non-abelian minimal normal subgroups

Proof: H has a unique minimal normal subgroup

Let M denote the unique minimal normal subgroup of H.

Proof: H has a unique minimal normal subgroup

Let M denote the unique minimal normal subgroup of H.

- If M is not abelian there is nothing to prove.

Proof: H has a unique minimal normal subgroup

Let M denote the unique minimal normal subgroup of H.

- If M is not abelian there is nothing to prove.
- If M is abelian then we need to prove that it is complemented. Since $\Phi(H) = 1$, then there exists a maximal subgroup K that does not contain M. We have that $K \cap M \triangleleft K$ and $K \cap M \triangleleft M$ (since M is abelian). Thus $K \cap M \triangleleft KM = H$ and since $K \cap M \subset M$, $K \cap M = 1$.

Sketch of Proof: H has more than one minimal normal subgroup

- Let N_1 be a minimal normal subgroup of H. For any other minimal normal subgroups N_r of H ($N_1 \neq N_r$), there exists a subgroup K_r of H that complements both N_1 and N_r in H.

Sketch of Proof: H has more than one minimal normal subgroup

- Let N_1 be a minimal normal subgroup of H. For any other minimal normal subgroups N_r of H ($N_1 \neq N_r$), there exists a subgroup K_r of H that complements both N_1 and N_r in H.
- The projections $\pi_r : K_r \cap (N_1 \times N_r) \to N_1$ and $\rho_r : K_r \cap (N_1 \times N_r) \to N_r$ are isomorphisms. Thus there is an isomorphism $\phi_r : N_1 \to N_r$, specifically $\phi_r = \rho_r \pi_r^{-1}$.

Sketch of Proof: H has more than one minimal normal subgroup

- Let N_1 be a minimal normal subgroup of H. For any other minimal normal subgroups N_r of H ($N_1 \neq N_r$), there exists a subgroup K_r of H that complements both N_1 and N_r in H.
- The projections $\pi_r : K_r \cap (N_1 \times N_r) \to N_1$ and $\rho_r : K_r \cap (N_1 \times N_r) \to N_r$ are isomorphisms. Thus there is an isomorphism $\phi_r : N_1 \to N_r$, specifically $\phi_r = \rho_r \pi_r^{-1}$.

From this follows that either all the minimal normal subgroups of H are abelian or all of them are non-abelian.

Sketch of Proof: H has abelian normal subgroups

- We have that $soc(H)$ is complemented in H, say by K.

Sketch of Proof: H has abelian normal subgroups

- We have that $soc(H)$ is complemented in H, say by K.
- Let $L = N_1 K$. Each minimal normal subgroup N_r of H is complemented in $soc(H)$, say by C_r and there exists a surjective homomorphism $\Psi_r \colon H \to L$ with $\ker \Psi_r = C_r$.

Sketch of Proof: H has abelian normal subgroups

- We have that $soc(H)$ is complemented in H, say by K.
- Let $L = N_1 K$. Each minimal normal subgroup N_r of H is complemented in $soc(H)$, say by C_r and there exists a surjective homomorphism $\Psi_r \colon H \to L$ with $\ker \Psi_r = C_r$.
- There exists a positive integer q such that the function

$$\begin{aligned} \Psi \colon H &\longrightarrow L_q \\ ks &\mapsto (\Psi_1(ks), \Psi_2(ks), \ldots, \Psi_q(ks)) \end{aligned}$$

is an isomorphism.

Sketch of Proof: H has abelian normal subgroups

- We have that $soc(H)$ is complemented in H, say by K.
- Let $L = N_1 K$. Each minimal normal subgroup N_r of H is complemented in $soc(H)$, say by C_r and there exists a surjective homomorphism $\Psi_r \colon H \to L$ with $\ker \Psi_r = C_r$.
- There exists a positive integer q such that the function

$$\begin{aligned} \Psi \colon H &\longrightarrow L_q \\ ks &\mapsto (\Psi_1(ks), \Psi_2(ks), \dots, \Psi_q(ks)) \end{aligned}$$

  is an isomorphism.
- The group L has a unique minimal normal subgroup, namely N_1, and it is complemented by K.

Sketch of Proof: H has non-abelian normal subgroups

- Let $\alpha_1\colon H \to Aut\, N_1$ that sends each $h \in H$ to
$$\begin{aligned}\alpha_1(h)\colon N_1 &\to N_1\\ x &\mapsto hxh^{-1}.\end{aligned}$$
Let L denote the image of α_1.

Sketch of Proof: H has non-abelian normal subgroups

- Let $\alpha_1 \colon H \to Aut\, N_1$ that sends each $h \in H$ to
$$\begin{aligned} \alpha_1(h) \colon N_1 &\to N_1 \\ x &\mapsto hxh^{-1}. \end{aligned}$$
Let L denote the image of α_1.
- The group L has a unique minimal normal subgroup.

Sketch of Proof: H has non-abelian normal subgroups

- Let $\alpha_1 \colon H \to Aut\, N_1$ that sends each $h \in H$ to
$$\begin{aligned}\alpha_1(h) \colon N_1 &\to N_1\\ x &\mapsto hxh^{-1}.\end{aligned}$$
Let L denote the image of α_1.
- The group L has a unique minimal normal subgroup.
- For $r > 1$, we define $\alpha_r \colon H \to Aut\, N_1$ as the homomorphism that sends $h \in H$ to
$$\begin{aligned}\alpha_r(h) \colon N_1 &\to N_1\\ x &\mapsto \phi_r^{-1}(h\phi_r(x)h^{-1}).\end{aligned}$$

Sketch of Proof: H has non-abelian normal subgroups

- Let $\alpha_1 \colon H \to Aut\, N_1$ that sends each $h \in H$ to
$$\begin{aligned} \alpha_1(h) \colon N_1 &\to N_1 \\ x &\mapsto hxh^{-1}. \end{aligned}$$
  Let L denote the image of α_1.
- The group L has a unique minimal normal subgroup.
- For $r > 1$, we define $\alpha_r \colon H \to Aut\, N_1$ as the homomorphism that sends $h \in H$ to
$$\begin{aligned} \alpha_r(h) \colon N_1 &\to N_1 \\ x &\mapsto \phi_r^{-1}(h\phi_r(x)h^{-1}). \end{aligned}$$
- Taking q as the number of minimal normal subgroups of H, the function
$$\begin{aligned} \Psi \colon H &\to L_q \\ h &\mapsto (\alpha_1(h), \ldots, \alpha_q(h)) \end{aligned}$$
  is an isomorphism.

Sketch of Proof: $q = f(L, m)$

Regardless of which case we consider, we proved that $H \cong L_q$ for some positive integer q by some isomorphism Ψ. Since the image of a minimal normal subgroup by an isomorphism is again a minimal normal subgroup we obtain that for any minimal normal subgroup N_r of H, $H/N_r \cong L_q/\Psi(N_r)$ and $H/N_r \cong L_{q-1}$. Since H/N_r is a proper non-trivial quotient of H we get that

$$d(L_{q-1}) = d(H/N_r) < d(H) = d(L_q).$$

This is precisely the definition of the function f. $\square$

The function f

Definition

Given a surjective homomorphism $\beta \colon L_k \to L/M$, we define the set $\mathscr{S}_\beta$ as the set of normal subgroups N of L_k arising as kernels of those homomorphisms of L_k onto L which composed with the natural projection $\pi_L \colon L \to L/M$ yield β.

The function f

Theorem

Let us assume that M is abelian. Given a surjective homomorphism $\beta\colon L_k \to L/M$, the cardinality of the set $\mathscr{S}_\beta$ is k when M is non-abelian; it is $(q^k - 1)/(q-1)$ when M is abelian and q is the number of (L/M)-endomorphisms of M.

Theorem

Let us assume that M is not abelian. Given a surjective homomorphism $\beta\colon L_k \to L/M$, the cardinality of the set $\mathscr{S}_\beta$ is k.

The function f

Definition

Let F be a free group of rank m. Given a surjective homomorphism $\beta\colon F \to L/M$, we define the set $\mathscr{R}_\beta$ as the set of normal subgroups N of F arising as kernels of those homomorphisms of F onto L which composed with the natural projection $\pi_L\colon L \to L/M$ yield β.

The function f

Definition

Let F be a free group of rank m. Given a surjective homomorphism $\beta\colon F \to L/M$, we define the set $\mathscr{R}_\beta$ as the set of normal subgroups N of F arising as kernels of those homomorphisms of F onto L which composed with the natural projection $\pi_L\colon L \to L/M$ yield β.

Theorem

Let F be a free group of rank $m \geq d(L)$. Given a surjective homomorphism $\beta\colon F \to L/M$, the cardinality of the set $\mathscr{R}_\beta$ is $\phi_L(m)/|\Gamma|\phi_{L/M}(m)$, where Γ denotes the set of all automorphisms of L that act trivially on L/M.

The function f

Theorem

Let F be a free group of rank $m \geq d(L)$ and $\beta\colon F \to L/M$ a surjective homomorphism. The group $F/(\bigcap_{N \in \mathscr{R}_\beta} N)$ is isomorphic to L_q for some positive integer q. Furthermore q is the biggest integer for which there exists a surjective homomorphism $\Psi\colon F \to L_q$ such that

$$\pi_{L_q} \circ \Psi = \beta.$$

The function f

Theorem

Let $m \geq d(L)$ and q be the number of (L/M)-endomorphisms of M when M is abelian. Then

$$f(m) = 1 + \begin{cases} \phi_L(m)/(|\Gamma|\phi_{L/M}(m)) & \text{if } M \text{ is not abelian,} \\ log_q(1 + (q-1)\phi_L(m)/|\Gamma|\phi_{L/M}(m)) & \text{if } M \text{ is abelian.} \end{cases}$$

Idea of the proof

- First prove that

$$f(m) = 1 + k.$$

Idea of the proof

- First prove that
$$f(m) = 1 + k.$$
- Find surjective homomorphisms α, β to obtain:

$$\frac{\phi_L(m)}{|\Gamma|\phi_{L/M}(m)} = |\mathscr{R}_\beta| =$$
$$|\mathscr{S}_\alpha| = \begin{cases} k & \text{if } M \text{ is not abelian,} \\ (q^k - 1)/(q-1) & \text{if } M \text{ is abelian.} \quad \square \end{cases}$$
